1.0 ORGANIZATIONAL STRUCTURE

2.0 INTRODUCTION

Nowadays, everything is running in an online system or can be considered as a new norm where we do almost everything online. Doing things online can surely help us in a convenient way. This is because it is easier for us humans to do work anywhere and anytime. Moreover, This way of working must have its own drawbacks. For instance, we need to have an internet connection so that we are able to communicate or do our work worldwide.

Furthermore, after a full briefing with the team members everyone has agreed and decided to make a system that could make it easier in the entertainment industry which is a cinema ticketing system. Buying a ticket online would be so much faster and time saving rather than going to the cinema and buying the ticket there.This brings up the reason why we made a system that serves the same purpose as the real online ticketing system.

This ticketing system allows users to make bookings or purchases of a movie ticket. This system also keeps the details of the customer who enters their information in an arranged order so that any info that has been recorded could be easily found by the system.This system keeps things in order and saves significant time because they organize the process of booking and terminate a number of issues such as wrong ticket bookings or canceling the ticket and so on, thus making it less time consuming for the actual work. Moreover, this sort of system will drastically reduce the effort or time to get to the cinema physically whether by car or public transportations as a result will improve the way of buying tickets and managing it in a more efficient way.

This system also provides up to date information about the movies in an organized schedule. Therefore will minimize any miscommunications between the customer because the admin will always update the movie details if there are any changes to make sure the customer gets the latest info and is able to make decisions without regretting them. To add more, the system will provide full details that the customer would need to watch the movie such as the halls and the seats that they have choosen. What's more the system will provide a receipt that shows what the customer has bought such as food and beverages and their movie ticket details after the calculation has been done. However the customer has a choice to cancel their booking of the ticket before the payment. This will facilitate the process for the customer if they made any changes and is more user-friendly to them.

The system that we made can be used by two users, the administrator of the cinema and the customer of the cinema. For the admin, they can update the data of the movie. To update the data the admins need to login and enter the username and password. From that, they can update the data of the movie they want to update and the information of the movie. The system will calculate the total price for the customer when all the information have been provided for the system such as the ticket price for the movie according to the types of tickets the customer are getting and if there is a food beverages as an add on, the system will also conclude the price in the total price and show the customer the total price. We also hoped to make a more advanced system that can redirect the customer to the payment system if they choose to pay by other method such as online banking.

3.0 OBJECTIVES

The main objectives for project "**MSS Cinema Online Ticket System**" is more focused on to create a movie online ticket processing that allows customers to get know about new movies that have been released, their schedule and the price for the ticket, etc.This system also create an easier way to manage the information that needs changes upon the movie details and seating details systematically.

The goals of the the "MSS Cinema Online Ticket System" project are as follows:

- Facility to store the data of the customers and administrator, different types of movie show timing, seats for the customers, etc.
- To achieve a convenient way of managing customer details and creating a user-friendly environment
- Facility that can protect privacy for every user with the password that the users use when they want to login.
- To reduce time for customers to buy tickets because they do not have to queue at the counter and they can buy it anywhere and anytime they want.
- Easy to promote the movie on the internet and can attract the audience

4.0 SCOPE

Class diagram

There are 6 classes; Admin, Customer, GoldTicket, PremiereTicket, MovieInfo, Ticket :

- GoldTicket and PremiereTicket are types of tickets. This implies an inheritance relationship where Ticket has general attributes. Both are subclasses that inherit Ticket Class.
- Customer and Ticket has a one-to-one relationship with composition links. They are dependent on each other.

Use Case diagram

1. In this system there are 2 actors involved which are the customer and administrator. The admin does a different process than customers.

2. Processes for administrator;

- Administrator can add information about the movie such as:

  -movie name

  -movie rated

  -movie genre

  -movie director

  -movie cast

  -movie showing time

- Administrator can add information about customer such as:

  -customer membership(member/ not)

- Administrator can calculate and display the total Price of the customer purchase in the receipt
- Administrator can display the movie details and details of purchase in the receipt

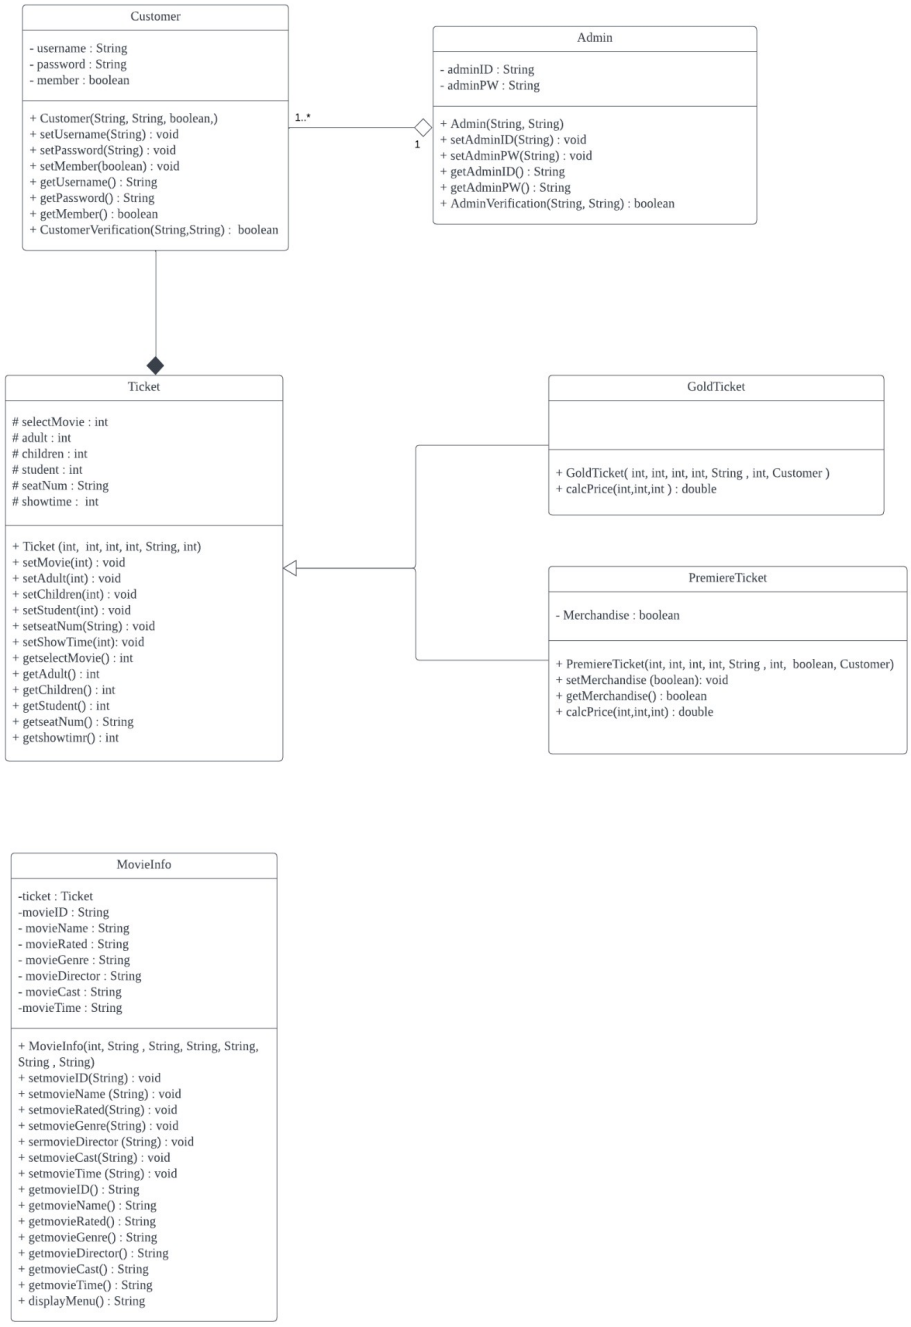

3. Process for customer;

- Customer have to log in and menu will be shown
- Customer can choose to whether to buy movie tickets or not
- Customer can choose whether to buy gold ticket or premiere ticket
- Customer can choose what movie they want to watch
- Customer can choose the the showing time for the movie
- Customer can choose the seat number

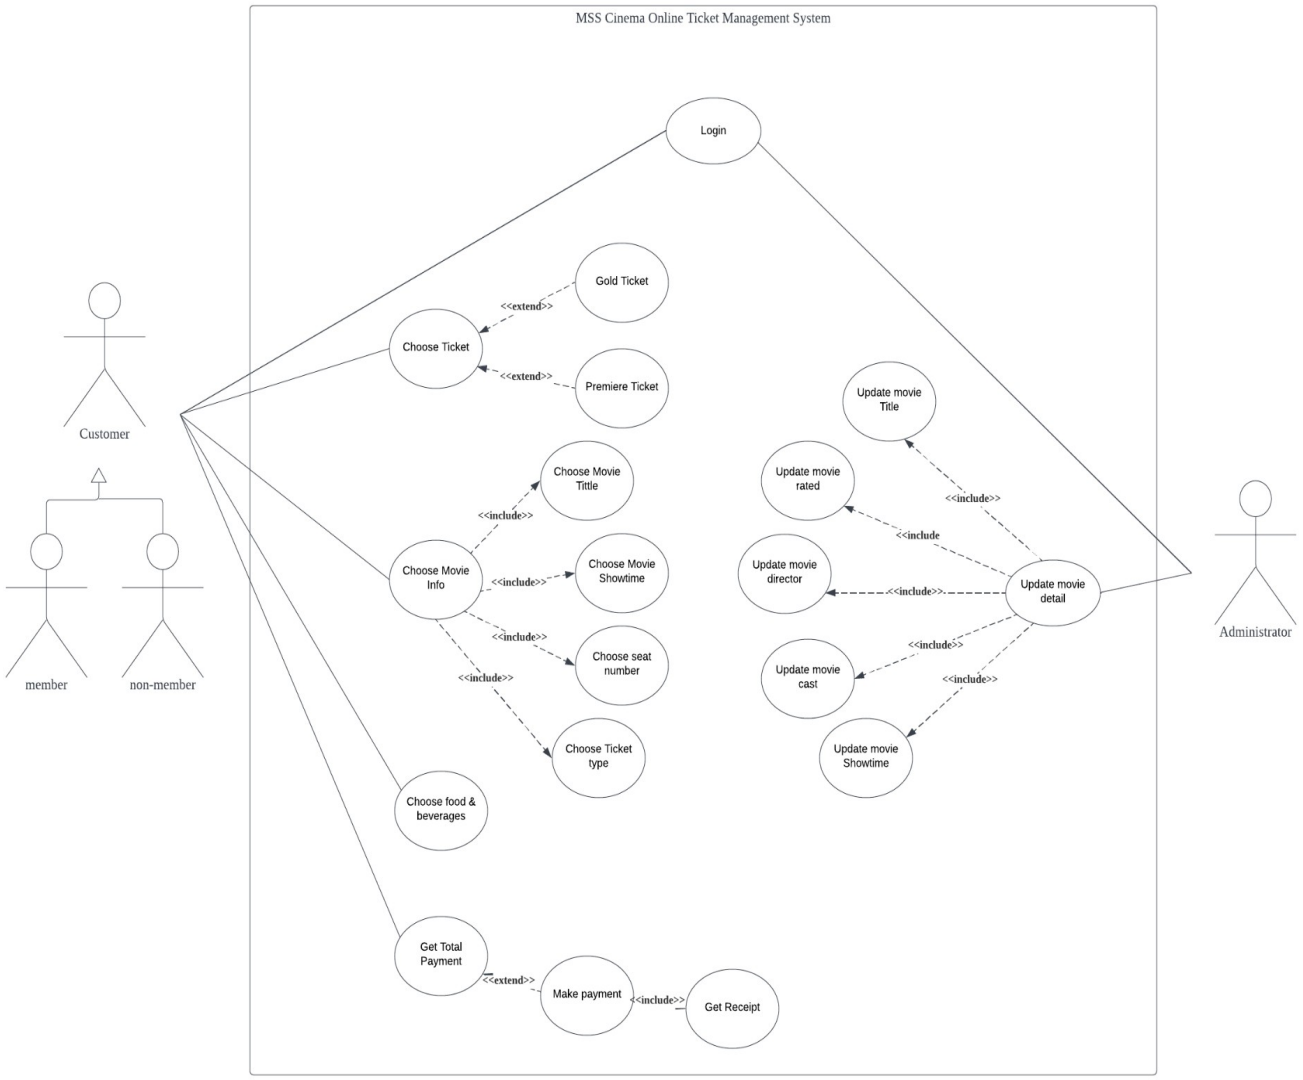

- Customer can choose if they want to add on food & beverages or not
- Customer can make payment according to the total payment shown in the receipt

7.0 CLASS DEFINITION OF INHERITANCE, POLYMORPHISM AND RELATED CLASSES

Customer class:

```
import java.io.*;
import java.util.*;

public class Customer{
    //attributes
    private String username;
    private String password;
    private boolean member;

    // normal constructor
    public Customer(String nm, String pass, boolean mbr) {
        username = nm;
        password = pass;
        member = mbr;
    }

    // setters
    public void setUsername(String nm) {username = nm;}
    public void setPassword(String pass) {password = pass;}
    public void setMember(boolean mbr) {member = mbr;}

    // getters
    public String getUsername() {return username;}
    public String getPassword() {return password;}
    public boolean getMember() {return member;}

    // processor
    public boolean CustomerVerification(String NM, String PASS){
        try{
            BufferedReader inRegisterUser = new BufferedReader(new FileReader("registeredUser.txt"));
            String inData = null;
            while((inData = inRegisterUser.readLine()) != null){
                StringTokenizer st = new StringTokenizer(inData,";");
                String nm  = st.nextToken();
                String pass = st.nextToken();
                if(nm.equals(NM) && pass.equals(PASS))
                    return true;
            }

            inRegisterUser.close();
        }
        catch(FileNotFoundException fnf){
            System.out.println(fnf.getMessage());
        }
        catch(IOException ioe){
            System.out.println(ioe.getMessage());
        }
        catch(Exception e) {
            System.out.println("Problem: "+e.getMessage());
        }
        return false;
    }
}
```

Admin class:

```
import java.io.*;
import java.util.*;

public class Admin{
    //attributes
    private String adminID;
    private String adminPW;

    // normal constructor
    public Admin(String id, String pw) {
        adminID = id;
        adminPW = pw;
    }

    // setter
    public void setAdminID(String id) {adminID = id;}
    public void setAdminPW(String pw) {adminPW = pw;}

    //getter
    public String getAdminID() {return adminID;}
    public String getAdminPW() {return adminPW;}

    //processor
    public boolean AdminVerification(String ID, String PW){
        try{
            BufferedReader in = new BufferedReader(new FileReader("admin.txt"));
            String inData = null;
